-> Decision-Making Under (AI) Uncertainty

Defining the operating reality for **AI-native businesses**

Martin Koch

Executive Advisor and founder

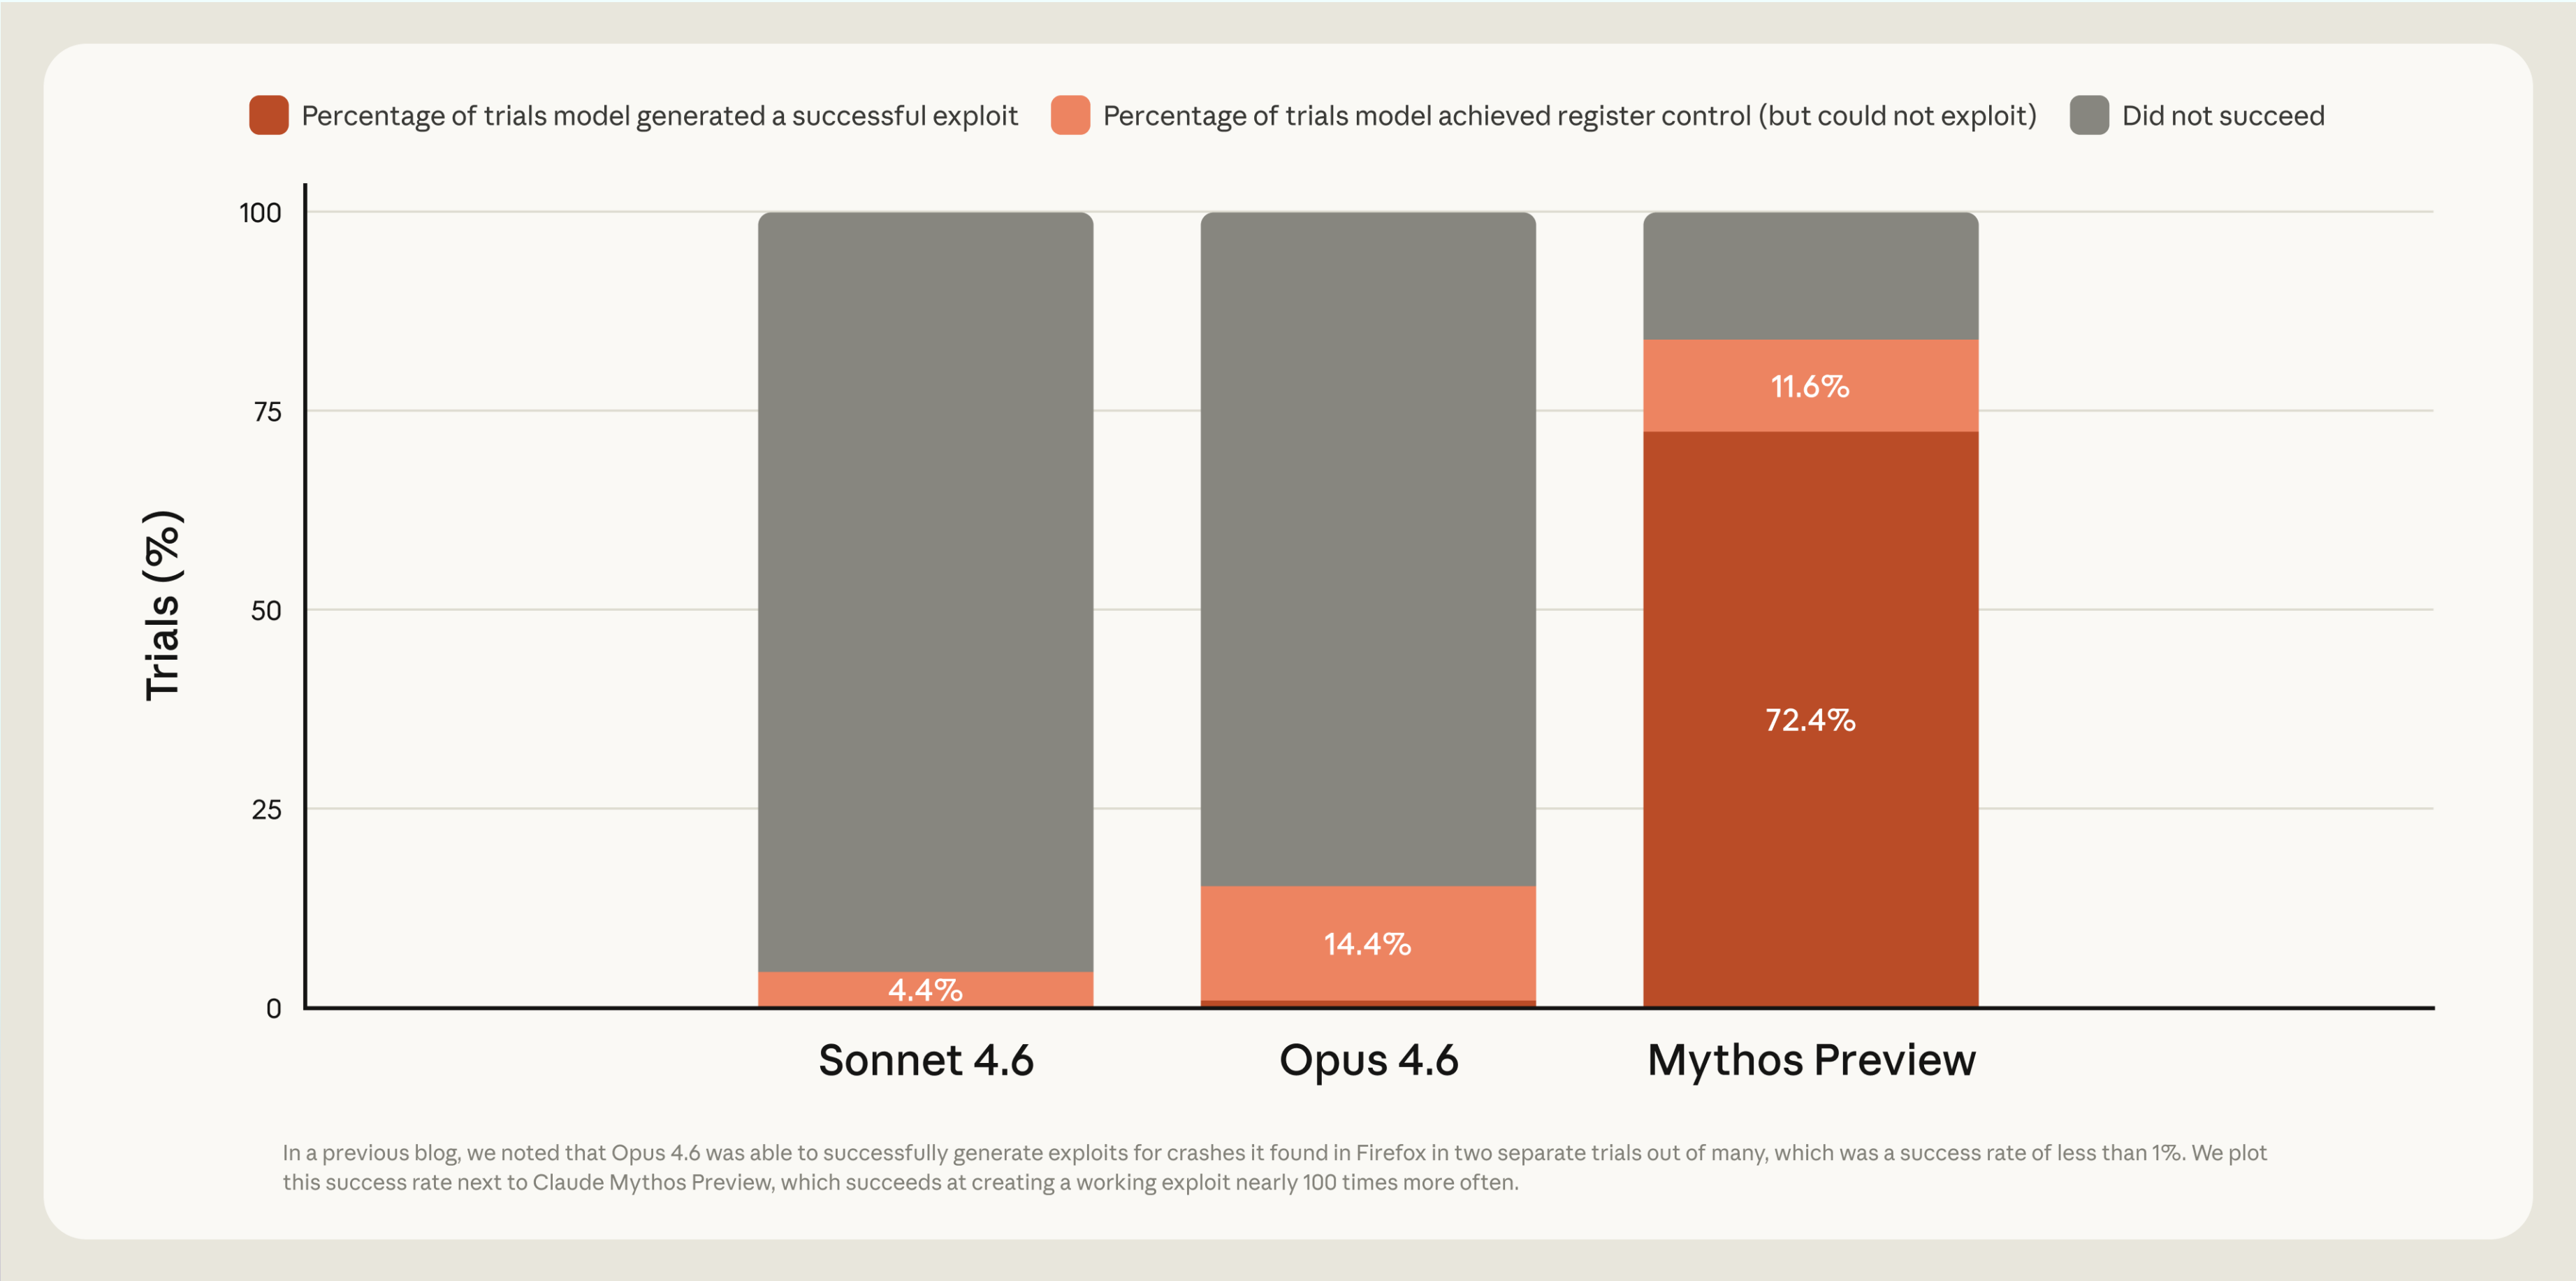

[MokanTech AB](#)

Experience

- CIO/CTO
- Business Development
- Architect

AI is exponentially faster and better now than 3 months ago

April 7th 2026, <https://red.anthropic.com/2026/mythos-preview/>

AI is **exponentially faster** and **better** now than 3 month ago

Exposure to attacks is increasing exponentially
Window to respond is shrinking
Even zero-day attacks are becoming accessible

In a previous blog, we noted that Opus 4.6 was able to successfully generate exploits for crashes it found in Firefox in two separate trials out of many, which was a success rate of less than 1%. We plot this success rate next to Claude Mythos Preview, which succeeds at creating a working exploit nearly 100 times more often.

This breaks how organisations **make decisions**

Past-driven

- Historical data gives the answer
- More data is always better
- Uncertainty is considered rare
- Humans make all decisions

Uncertainty-driven:

- Include Just-In-Time data
- Limit the amount of datapoint
- Embrace the anomalies
- Encode governance

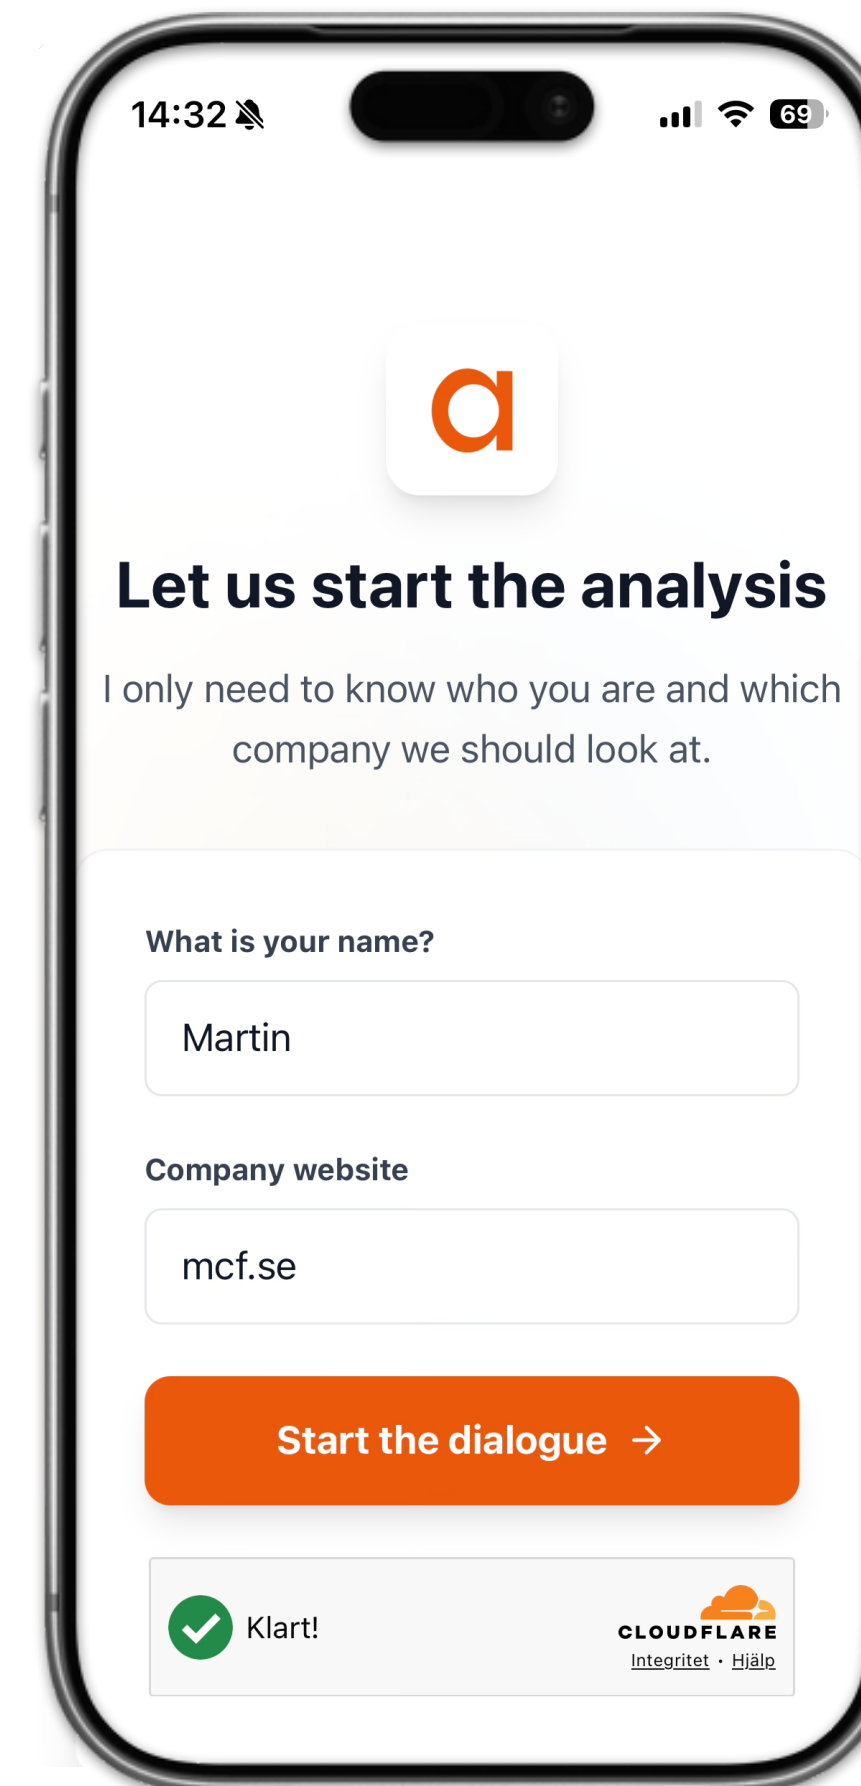

Kanita Triage

A simple way to test

- Faster decisions
- Need for less data
- Move without full understanding

Better decisions in time

With MokaTech, my purpose is simple

Proven experience in turning ideas into execution

- Turn concepts into **testable reality**
- **Validate fast** in real operational environments
- **Execute responsibly** in regulated, high-risk domains

To execute where most projects fail

Looking for partners targeting SecureAI

Targeted Call:

SecureAI (HORIZON-CL3-2026-02-CS-ECCC-02)

Transform decision-making under uncertainty, validate and scale in real environments.
